Notes to data structure:

- **tID** is the unique ID applied to each transaction. Because this is consistant accross all transaction record subsets, you can use this to search for a particular record accross tabs.
- **IN_TRANSACTION_CODE** is the same as **TRANSACTION_CODE**, but named differently because this subset holds only "in-bound" transactions.
- **nOutTrans** the count of "out-bound" transactions made by the same filing entity within a post 30-day period of the "in-bound" transaction.
- **totalOut** the sum of "out-bound" transaction **AMOUNT_70** made by the same filing entity within a post 30-day period of the "in-bound" transaction.
